

Paul Is the General Laboratory Manager and is usually your first point of contact at the lab.

Paul is responsible for the smooth running of the lab. He inspects the prescriptions, books the items in and controls the workflow of each separate restoration throughout the different departments of the lab, identifying any work, which requires special attention. His involvement at these early stages means that any issues such as price queries changes to prescription or special delivery needs can be immediately addressed.

As well as this Paul oversees all model production and personally sets up all the Denar articulators for the other technicians to work on.

Paul also heads up the CAD/CAM team and is the lab expert on CAD/CAM produced restorations, utilising many different systems including Lava Design, Atlantis, dental Wings and the Straumann CS2 system.

Another major part of Paul's daily workload is downloading and analysing the digital impressions we receive, ensuring everything is right and that all correct components are ordered before the milling centres manufacture the models.

Paul is now in his 9th year at the lab.
